World Monitor privacy policy and data handling

World Monitor · version **2026-11-02** · Authoritative text: https://www.worldmonitor.app/docs/privacy · Previous versions: https://github.com/koala73/worldmonitor/commits/main/docs/privacy.mdx

Last updated: 2 November 2026

Download: PDF · Markdown

This Privacy Policy explains how **World Monitor FZ LLC, a free zone limited liability company registered in Dubai, United Arab Emirates** ("World Monitor", "we", "us"), handles information when you use the World Monitor dashboard, website, API, MCP server, and apps (the "Service").

This page is written in plain language and is not legal advice.

The short version

- The basic dashboard works **without an account and without signup**.
- We do not sell your personal data.
- We use a small set of established subprocessors for authentication, payments, hosting, error monitoring, and AI analysis — listed in full below.
- You can request access to, export of, or deletion of your account data at any time.

Information we collect

Account information. If you create an account or upgrade to Pro, our authentication provider (Clerk) processes your email address, name, and login credentials. We store account identifiers and your plan/entitlement state in our database (Convex).

Payment information. Subscriptions are processed by Dodo Payments, which acts as the merchant of record. Your full card details are entered with and held by the payment processor — **World Monitor never receives or stores your full card number.** We receive limited billing metadata (such as plan, status, country, and the last four digits) needed to manage your subscription. When you subscribe, we also attach how you first reached World Monitor (see the `wm-acq` cookie below) to the subscription, so we can see which channels lead to paid plans.

Usage and diagnostics. To keep the Service reliable we collect:

- **Error and crash diagnostics** via Sentry (e.g. error messages, stack traces, browser and device type).
- **Privacy-oriented product analytics** via Vercel Web Analytics, Cloudflare, and our self-hosted Umami instance (`abacus.worldmonitor.app`) — used to understand traffic patterns. These are designed to avoid cross-site tracking, and where configured are cookieless. For signed-in users, Umami events also carry your account identifier, plan, and subscription status, so we can see how each plan uses the product.

- **Page-performance monitoring (RUM)** via DebugBear on a 10% sample of page loads. It receives the page path, viewport and device pixel ratio, navigation and web-vitals timings, and the user agent, along with the IP address inherent in any web request, plus any browser errors raised on a sampled page (error messages, stack traces, and source URLs). **URL query parameters are not part of its page data** — the dashboard state your address bar carries (map view, time range, selected layers) is not stored with page views. A browser error report can still include the page address with its query string, so that dashboard state may appear in error data. DebugBear does not load while the address carries sign-in tokens, checkout or referral codes, or email parameters. It is used to find slow and unstable pages, not to identify or track you.
- **Server and request logs** via Axiom and our hosting/CDN providers (Vercel, Cloudflare), including IP address, user agent, and request metadata, retained for security and debugging.

Content you submit to AI features. When you use AI briefings, analysis, forecasts, or the research assistant, the text of your query and the relevant context are sent to our AI providers (Anthropic and, via OpenRouter, other model providers) to generate a response. Do not submit sensitive personal data into AI prompts.

Questions we ask you. After you sign in, we may ask a few questions about you: what you mainly use World Monitor for, whether you use it for personal use or for work, who pays for it, your role and industry, and, in an optional free-text box, what you would use if World Monitor did not exist. If you cancel a subscription, we also keep the reason and comment you give, and whether you or someone else cancelled. Our payment provider, Dodo Payments, collects these when you cancel through it; if it has no reason, we may ask you ourselves. Answering is optional, and skipping a question does not change what you can use. We store the answers with your account in our database (Convex) and use them to understand who uses the Service and why, so we can shape plans and pricing. To do that, a weekly report generated by Anthropic reads the answers and cancellation reasons together with your plan, payment status, and usage. The answers and cancellation reasons are deleted when you delete your account.

Preferences and alerts. Settings such as saved locations, alert rules, and layer preferences are stored in your browser (local storage) and, for signed-in users, in our database (Convex).

Cookies and local storage

- **Essential** — authentication sessions (Clerk) and security use cookies or equivalent storage that are required for signed-in features to work.
- **Preferences** — dashboard settings are stored locally in your browser.
- **Analytics** — our analytics are designed to be privacy-friendly and, where configured, do not use tracking cookies.
- **Acquisition source** — one first-party cookie, `wm_acq`, kept for 90 days on `worldmonitor.app`, records how you first arrived: the campaign tags in the link (`utm_source`, `utm_medium`, `utm_campaign`), the domain of the referring site (not the page), the type of page you landed on, and the date. It is sent with a checkout so the subscription records the channel. It is not shared with advertisers or used on other sites.

Data Processing Addendum

If you use the Service to process personal data and need a processor agreement, the Data Processing Addendum applies automatically — no signature required — and incorporates the EU standard contractual clauses and the UK addendum for international transfers. A countersigned copy is available on request.

Subprocessors

We share personal data only with the service providers below, which process it on our behalf to run the Service. Each row says what personal data reaches that provider. The table also names the one analytics collector we host ourselves, so it can be reconciled against anything you see in a network log.

Provider	Purpose	Personal data it processes
Clerk	Authentication and account management	Name, email address, login credentials, and session tokens
Convex	Application database (accounts, billing records, entitlements, API keys, alerts, preferences)	Account identifiers, name and email address, subscription and payment records (including payment-provider customer details), plan and entitlement state, API keys (stored as hashes), alert rules and the destinations you connect, saved preferences, answers to the questions we ask you and the reasons you give for cancelling, and messages you send through our contact forms
Dodo Payments	Payment processing and subscription billing (merchant of record)	Name, email address, billing details, and card details, which Dodo Payments holds; we receive the plan, status, country, and last four digits. We also send your account email and name to fill in the checkout form (you can change both there), and how you first arrived (campaign tags, referring domain, landing page type). If you cancel, it collects the reason and comment you give and sends them to us
Sentry	Error and crash monitoring	Error messages, stack traces, browser and device type, and the IP address inherent in any web request
DebugBear	Real-user page-performance monitoring (10% sample of page loads)	Page path, viewport, navigation and web-vitals timings, user agent, IP address, and browser errors on a sampled page (error messages, stack traces, and source URLs)

Provider	Purpose	Personal data it processes
Umami (self-hosted, `abacus.worldmonitor.app`)	Product analytics, running in our own Railway project — no analytics vendor receives this data	Page views and product events, with the browser and device details a web request carries; for signed-in users, your account identifier, plan, and subscription status
Upstash	Rate-limit and cache store	Rate-limit keys derived from your IP address, cached entitlement records, and short-lived cached responses
Railway	Container hosting for our background services: alert and digest delivery, the data relay (including the widget builder), and our Umami analytics instance and its database	Alert and digest content and the destination identifiers it is delivered to, prompts you send to the widget builder, and the Umami analytics events stored in its database (including, for signed-in users, your account identifier, plan, and subscription status)
Mintlify	Documentation site hosting (`worldmonitor.app/docs`, including this page)	IP address and user agent of documentation page requests
Vercel	Application and API hosting, and web analytics	IP address, user agent, and request metadata, and the content of API requests and responses in transit
Cloudflare	Content delivery, edge security, bot challenges (Turnstile), web analytics, and object storage (R2)	IP address, user agent, request metadata, and Turnstile challenge signals
Axiom	Application logging and observability	IP address and approximate location (city, region), user agent, referrer, request metadata, and your account identifier
Anthropic	AI model provider for analysis, briefings, the widget builder, and our weekly product-research report	The text of your AI queries and the context sent with them; for the product-research report, your answers to the questions we ask you, the reasons you give for cancelling, and your account identifier, plan, payment status, and usage
OpenRouter	AI model routing for analysis and forecasts; it passes each request to the model provider it routes to	The text of your AI queries and the context sent with them
Resend	Transactional email delivery	Recipient email address and the email's content

We give at least 30 days' notice before a new subprocessor starts processing personal data, as set out in section 8 of the Data Processing Addendum.

Where your alerts go

If you connect an alert or digest channel, we transmit the alert content you asked for to the destination **you** chose: Telegram, Slack, Discord, a webhook URL of yours, email, or a browser push endpoint. To do that we store the identifiers that channel needs — a chat or channel id, a webhook URL, or the OAuth token you granted us — and nothing more.

Those destinations are not our subprocessors: they receive your alerts because you directed them to, and what they do with the content is governed by your own relationship with them. Disconnecting a channel deletes the identifiers we hold for it.

How we use information

We use the information above to operate and secure the Service, authenticate users, process subscriptions, generate AI analysis you request, communicate with you about your account, understand who uses the Service and why so we can shape plans and pricing, and improve reliability and performance. We rely on legitimate interests, contract performance, and — where applicable — your consent as the legal bases for this processing.

Data retention

We keep account and subscription data for as long as your account is active and as needed to meet legal, tax, and security obligations. Diagnostic and log data is retained on a rolling basis for a limited period. When you delete your account, we delete or anonymize associated personal data, except where we must retain it by law.

Your rights

Depending on where you live (including under the EU/UK GDPR and the California CCPA/CPRA), you may have the right to access, correct, export, or delete your personal data, and to object to or restrict certain processing. Signed-in users can delete their World Monitor account from **Avatar → Plan & billing → Delete account** by typing `DELETE`; see Accounts. If you cannot sign in, write from the account email to support@worldmonitor.app so we can confirm the Clerk user id. Anonymous dashboard use has no server account — clear local site data instead. To exercise any of these rights, contact us at support@worldmonitor.app. You also have the right to complain to your local data protection authority.

International transfers

Our subprocessors may process data in countries other than yours, including the United States. Where required, transfers are covered by appropriate safeguards such as standard contractual clauses.

Children

The Service is not directed to children and is not intended for use by anyone under the age required by their local law to consent to data processing. We do not knowingly collect personal data from children.

Changes

We may update this policy as the Service evolves. Material changes will be reflected here with a new "Last updated" date.
